🎯 Aerofit - Descriptive Statistics & Probability

🔍 About Aerofit

Aerofit is a leading brand in fitness equipment, offering products like:

- Treadmills
- Exercise bikes
- Gym equipment
- Fitness accessories

🎯 Problem Statement

Identify the buyer audience characteristics for each type of treadmill offered by Aerofit.

🎯 Business Problem

The market research team wants to understand the customer characteristics for each treadmill product.

- **KP281** Entry level treadmill (80,308)
- **KP481** Mid level treadmill (57,335)
- **KP781** Advanced features treadmill (32,548)

🎯 Objectives

1. **Descriptive Analytics**: Create customer profiles for each treadmill product.
2. **Probability Analysis**: Construct two way contingency tables, compute marginal and conditional probabilities.
3. **Business Insights**: Provide actionable recommendations based on data analysis.

[01] ```
import numpy as np
import pandas as pd
import matplotlib as mp
import matplotlib.pyplot as plt
from scipy import stats
from IPython.display import display, HTML

%matplotlib inline
%config InlineBackend.figure=='svg'

pd.set_option('display.notebook_repr_html', True)

pd.set_option('display')
ipd = lambda *args: display(*args)

pd.DataFrame._repr_html_ = lambda self: self.T.head(50).T.to_html()
```

# 1. Descriptive Analytics

[02] ```
# Loading data
df = pd.read_csv('/content/drive/MyDrive/Colab Notebooks/Aerofit/aerofit_treadmill.csv')

(180, 9)
2
Index(['Product', 'Age', 'Gender', 'Education', 'MaritalStatus', 'Usage',
       'Fitness', 'Income', 'Miles'],
      dtype='object')
```

📦 Dataset

Collected data on individuals who purchased a treadmill in the past three months:

- **Product Purchased**: KP281, KP481, KP781
- **Age**: In years
- **Gender**: Male/Female
- **Education**: In years
- **Marital Status**: Single/Partnered
- **Usage**: Avg. planned weekly treadmill usage
- **Income**: Annual income ($)
- **Fitness**: Self-rated fitness (1 to 5 scale)
- **Miles**: Average weekly miles expected to walk/run

Shape of Data

[03] ```
rows, cols = df.shape
print(rows, cols)
print("Number of rows: {0}, Number of columns: {1}".
      format(rows, cols))
```

```

Inference:

Market Customer Segmentation: The data indicates distinct segments based on age, gender, and marital status. The dominant customer profile includes individuals in their mid-twenties with moderate education and partnered status. Understanding these demographic patterns is crucial for targeting and segmenting customers effectively.

✨ New Features Creation for Customer Segmentations 🎯

- **Age Groups Categorization**
  - Young Adult (17-25)
  - Adult (26-35)
  - Middle-aged (36-45)
  - Elderly (45-70)

[20] ```
print("Minimum age is:", df['Age'].min())
print("Maximum age is:", df['Age'].max())
```

```
Minimum age is: 18
Maximum age is: 50
```

[21] ```
# Creating a function to categorize age into different groups
def age_group(x):
    if x <= 25:
        return 'Young Adult'
    elif x <= 35:
        return 'Adult'
    elif x <= 45:
        return 'Middle-aged'
    else:
        return 'Elderly'

Applying the function to create a new column 'Age_Group'
df['Age_Group'] = df['Age'].apply(age_group)

# Displaying the first 5 rows to see the new column
df.head(5)
```

| | Product | Age | Gender | Education | MaritalStatus | Usage | Fitness | Income | Miles | Miles_Per_Day | Age_Group |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **0** | KP281 | 18 | Male | 14 | Single | 3 | 4 | 29562 | 112 | 3.733333 | Young Adult |
| **1** | KP281 | 19 | Male | 15 | Single | 2 | 3 | 31836 | 75 | 2.500000 | Young Adult |
| **2** | KP281 | 19 | Female | 14 | Partnered | 4 | 3 | 30699 | 66 | 2.200000 | Young Adult |
| **3** | KP281 | 19 | Male | 12 | Single | 3 | 3 | 32973 | 85 | 2.833333 | Young Adult |
| **4** | KP281 | 20 | Male | 13 | Partnered | 4 | 2 | 35247 | 47 | 1.566667 | Young Adult |

[22] ```
# Calculating the value counts of the new 'Age_Group' column

Young Adult    62
Middle-aged    37
Elderly         6
Name: count, dtype: int64
```

[23] ```
Calculating the proportions of each age group
df['Age_Group'].value_counts(normalize=True)*100
```

```
Age_Group
Adult          41.666667
Young Adult    34.444444
Middle-aged    20.555556
Elderly         3.333333
Name: proportion, dtype: float64
```

[24] ```
# Calculating the mean, median, and mode of the 'Miles_Per_Day' for each age group
df.groupby('Age_Group')['Miles_Per_Day'].mean()
df.groupby('Age_Group')['Miles_Per_Day'].median()
df.groupby('Age_Group')['Miles_Per_Day'].mode()
```

```
Age_Group
Adult          2.666667
Elderly        2.666667
Middle-aged    2.666667
Name: Miles_Per_Day, dtype: float64
Age_Group
Adult          2.666667
Elderly        2.666667
Middle-aged    2.666667
Name: Miles_Per_Day, dtype: float64
Age_Group
Adult          2.666667
Elderly        2.666667
Middle-aged    2.666667
Name: Miles_Per_Day, dtype: float64
```

Since there is no square root for Variance, let's compare with the median values

[25] ```
# Calculating the median of the 'Miles_Per_Day' for the entire dataset
median_miles = df['Miles_Per_Day'].median()

# Calculating the percentage difference between the median of each age group and the overall median
percentage_difference = (df.groupby('Age_Group')['Miles_Per_Day'].median() - median_miles) / median_miles * 100

# Displaying the percentage difference
print("Percentage difference between the median of each age group and the overall median:")
print(percentage_difference)
```

```
Percentage difference between the median of each age group and the overall median:
Age_Group
Adult          0.000000
Elderly        0.000000
Middle-aged    0.000000
Name: Miles_Per_Day, dtype: float64
```

```
Comparing the median values
Median Miles: 94.0
Median Miles for Young Adult: 94.0
Median Miles for Adult: 94.0
Median Miles for Middle-aged: 94.0
Median Miles for Elderly: 94.0
```

This encourages customer engagement and promotes a more balanced and practical approach to fitness.

[26] ```
# Calculating the median of the 'Miles_Per_Day' for the entire dataset
median_miles = df['Miles_Per_Day'].median()

# Calculating the median of each age group
median_by_age = df.groupby('Age_Group')['Miles_Per_Day'].median()

# Calculating the percentage difference
percentage_difference = (median_by_age - median_miles) / median_miles * 100

# Displaying the percentage difference
print("Percentage difference between the median of each age group and the overall median:")
print(percentage_difference)

# Comparing the median values
print("Comparing the median values:")
print("Median Miles: {0}".format(median_miles))
for age_group, median in median_by_age.iteritems():
    print("Median Miles for {0}: {1}".format(age_group, median))
```

```
Percentage difference between the median of each age group and the overall median:
Age_Group
Adult          0.000000
Elderly        0.000000
Middle-aged    0.000000
Name: Miles_Per_Day, dtype: float64
Comparing the median values:
Median Miles: 94.0
Median Miles for Adult: 94.0
Median Miles for Elderly: 94.0
Median Miles for Middle-aged: 94.0
```

Thus, the median values for Miles Columns will lead to a balanced result.
We have to check for the outliers in the Miles_Per_Day column as it denotes the ratio of usage

[27] ```
# Calculating the median of the 'Miles_Per_Day' for the entire dataset
median_miles = df['Miles_Per_Day'].median()

# Calculating the median of each age group
median_by_age = df.groupby('Age_Group')['Miles_Per_Day'].median()

# Calculating the percentage difference
percentage_difference = (median_by_age - median_miles) / median_miles * 100

# Displaying the percentage difference
print("Percentage difference between the median of each age group and the overall median:")
print(percentage_difference)

# Comparing the median values
print("Comparing the median values:")
print("Median Miles: {0}".format(median_miles))
for age_group, median in median_by_age.iteritems():
    print("Median Miles for {0}: {1}".format(age_group, median))
```

```
Percentage difference between the median of each age group and the overall median:
Age_Group
Adult          0.000000
Elderly        0.000000
Middle-aged    0.000000
Name: Miles_Per_Day, dtype: float64
Comparing the median values:
Median Miles: 94.0
Median Miles for Adult: 94.0
Median Miles for Elderly: 94.0
Median Miles for Middle-aged: 94.0
```

This is an outlier
The percentage difference from the median value per day indicates a significant deviation (200%) from the typical value

[28] ```
# Calculating the median of the 'Miles_Per_Day' for the entire dataset
median_miles = df['Miles_Per_Day'].median()

# Plotting the boxplot with the median line
sns.boxplot(x='Miles_Per_Day', data=df)
plt.axvline(median_miles, color='r', linestyle='--', label='Median')
plt.legend(loc='upper right')
plt.title('Boxplot of Miles_Per_Day with Median')
plt.show()
```

```
<ipykernel_3...>:2: UserWarning: Ignoring `palette` because no `hue` variable was assigned.
```

Decision: Its cap off the "Miles" data points, unless new evidence comes up to make this decision wrong

[29] ```

Descriptive Statistics for Age

count: 179.00 mean: 28.79 std: 6.95 min: 18.00 25%: 24.00 50%: 26.00 75%: 33.00 max: 50.00

1. **Skewness:** 1.51
2. **Kurtosis:** 3.86

Distribution of age_cat:

- **Young Adult:** 90 (30.0%)
- **Adult:** 54 (44.4%)
- **Middle-aged:** 34 (18.9%)
- **Elderly:** 12 (6.7%)

Inference:

The Age data represents a predominantly young population, with a noticeable skew towards younger ages.
The distribution of age categories suggests that, with the majority of individuals being classified as Young Adults and Adults.
The skewness and kurtosis values indicate that while the distribution is mostly normal, there are some outliers and a slight peak in the data.

Education

max      21.00
Name: Education, dtyp
```

Descriptive Statistics for Education

count: 179.00 mean: 15.57 std: 1.62 min: 12.00 25%: 14.00 50%: 16.00 75%: 16.00 max: 21.00

1. **Skewness:** 0.32
2. **Kurtosis:** 0.40

Distribution of edu_level:

- **Master's Degree:** 90 (36.0%)
- **Bachelor's Degree:** 90 (27.0%)
- **Doctorate:** 43 (24.0%)
- **High School or Less:** 10 (10.0%)

Inference:

The Education data represents a well-educated population with a notable concentration of individuals holding Master's and Bachelor's degrees.
The skewness and kurtosis values suggest a distribution slightly skewed to the right with a moderate peak around the most educated level.

Fitness

```
# Create figure with subplots
fig, ax = plt.subplots(1, 2, figsize=(15, 5))

# Histogram with KDE
sns.histplot(data=df, x='Fitness', kde=True, ax=ax[0])

```

Descriptive Statistics for Fitness

count: 179.00 mean: 3.30 std: 0.95 min: 1.00 25%: 3.00 50%: 3.00 75%: 4.00 max: 5.00

1. **Skewness:** 0.50
2. **Kurtosis:** 0.40

Distribution of fitness_level:

- **Moderate Fitness:** 90 (44.1%)
- **Medium Fitness:** 54 (30.0%)
- **High Fitness:** 35 (18.9%)
- **Low Fitness:** 12 (6.7%)

Inference:

The Fitness data depicts a population with a moderate level of fitness, with a slight skew towards higher fitness levels.
Most individuals fall into the moderate fitness category, with high fitness levels also quite prevalent.
Low fitness levels are less common in the sample.

Income

```
# Create figure with subplots
fig, ax = plt.subplots(1, 2, figsize=(15, 5))

```

Descriptive Statistics for Income

count: 179.00 mean: 53504.99 std: 16299.27 min: 29562.00 25%: 43174.50 50%: 50028.00 75%: 58251.50 max: 104581.00

1. **Skewness:** 1.40
2. **Kurtosis:** 2.20

Distribution of income_bracket:

- **Medium Income:** 90 (30.0%)
- **Low Income:** 54 (17.0%)
- **High Income:** 35 (53.0%)

Inference:

The Income data illustrates a population with a moderate level of income, featuring a right-skewed distribution with some individuals having higher incomes.
The majority of individuals belonging to the medium income bracket, with significant variability observed within the dataset.

Miles_Per_Day

```
# Create figure with subplots
fig, ax = plt.subplots(1, 2, figsize=(15, 5))

- **Skewness:** 0.93
- **Kurtosis:** 3.05

Distribution of miles: good

- **Medium Distance** (50.12%)
- **Long Distance** (21.87.12%)

Inference:

The Miles_Per_Day data shows that most people cover a moderate distance daily with a slight tendency towards shorter distances. Most are medium distance users, with fewer aiming for long or short distances. There's some variability in miles coverage.

       plt.show()
```

```
Gender  Female  Male
Product
KP281      40    40
KP481      31    29
KP781       2    57

Gender_Product_percentage:
Gender  Female  Male
Product
KP281   50.00  50.00
KP481   51.67  48.33
KP781    3.39  96.61
```

Hypothesis 5:

- **Null Hypothesis (H0):** No difference in product preference between males and females.
- **Alternative Hypothesis (H1):** Males may prefer different products than females.

Inferences:

- KP281 and KP481 show similar preference between genders.
- KP781 demonstrates a notable gender preference difference.
- This supports the hypothesis partially, especially regarding KP781.

```
[103]: # Calculate the mean and standard deviation for each product
       product_stats = data.groupby('Product')['Miles_Per_Day'].agg(['mean', 'std'])
       # Calculate the difference between the means
       mean_difference = product_stats['mean'].max() - product_stats['mean'].min()
       # Calculate the standard deviation of the means
       std_dev_of_means = product_stats['mean'].std()
       # Print the results
       print("Product stats:")
       print(product_stats)
       print("\nMean difference:", mean_difference)
       print("Standard deviation of means:", std_dev_of_means)
```

```
Product stats:
            mean       std
Product
KP281      44.61  8.677693
KP481      46.07  8.475601
KP781      84.80  9.654412

Mean difference: 40.19
Standard deviation of means: 21.900228
```

Hypothesis 6:

Null Hypothesis (H0): No relationship exists between fitness levels and miles goals.

Alternative Hypothesis (H1): Higher fitness levels correlate with larger distance goals.

Observed Inferences:

- **Low Fitness:** Prefers shorter distance goals only.
- **Moderate Fitness:** Mostly mediocre distance goals, some short, few long.
- **High Fitness:** Primarily long distance goals, rarely medium.

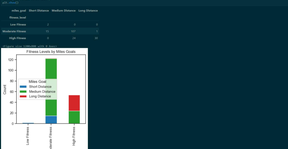
Conclusion:

- **Supported for H1:** Data suggests a link between fitness and miles goals.
- **Implication of H1:** Fitness level influences goal setting.

This supports the idea that higher fitness levels correlate with larger distance goals, supporting the null hypothesis.

Violin Plot - Product Preference vs. Age Categories

```
[104]: # Create the violin plot
       plt.figure(figure_size=(12, 6))
       sns.violinplot(x='Age_Category', y='Product', hue='Gender', split=True)
       plt.title('Product Preference by Age Categories')
       plt.xlabel('Age Category')
       plt.ylabel('Product')
       plt.legend(title='Gender')
       plt.show()
```



Inferences:

- **KP281 (Product 1):**
  - Strong female-leaning appeal across multiple age categories.
  - Adults: Balanced preference, slightly male-leaning.
  - Middle-aged: Balanced gender appeal.
  - Elderly: Low preference overall.
- **KP481 (Product 2):**
  - Strong female-leaning appeal across multiple age categories.
  - Adults: Nearly balanced, slightly male-leaning.
  - Middle-aged: Balanced gender appeal.
  - Elderly: Very low preference.
- **KP781 (Product 3):**
  - Primarily male-oriented product across all age categories.
  - Young Adults: Strong male preference.
  - Middle-aged: Male-prefer more.
  - Elderly: Low preference overall.

Overall:

- Women generally prefer products slightly more.
- Product preference varies across age groups.
- Elderly show lowest preference for all products.

Scatters Plot - Strong and very Strong Positive Correlations

```
[105]: # Define pairs of variables with strong and very strong positive correlations
       correlation_pairs = [

       plt.tight_layout()
       # Show the plot
       plt.show()
```

Simplified summary:

- **Product Bifurcation**
  - The chart shows products from the 60-70 age group.
  - The 80-100 and 40-50 age groups are shown in shades of blue.
- **Income and Age Trends**
  - The boxplot indicates that these products show a trend of increasing income as they get older.
  - Income data (IPV) ranges are centered around 100,000 (lower), reaching from age 50 onwards.
  - Blue dots (80-100 and 40-50) cannot stay below 80,000 income.
- **Age Distribution**
  - 80-100 income spans high variability in income.
  - 40-50 and 50-60 show little or no variability in income.

Key Insight:

These products help to understand the relationships between income, age, and the different product series from the charts.

```

Simplified Correlation Inferences:

For Males:

- **Product 80100:** Younger men with lower educational attainment, fitness levels, and income, who use this product infrequently and run fewer miles, tend to prefer this.
- **Product 40\|50:** Older men with higher educational attainment but similar fitness and income as 80100, and who also use the product infrequently and run fewer miles, prefer this.
- **Product 50\|60:** Older men with higher educational attainment, good fitness, higher income, who use the product frequently and run more miles, like this.

For Females:

- **Product 80100:** Younger women with lower educational attainment, who are in a partnership, and use the product infrequently, usually choose this.
- **Product 40\|50:** Older women with higher educational attainment, who are in a partnership, use the product frequently and run more, prefer this.
- **Product 50\|60:** Older women with higher educational attainment, who are in a partnership, use the product frequently and run more, prefer this.

2. Probability Analytics

The prompt, *Jimmerbell*, Inc.wants to designed for probability inferences analysis and analysis on categorical data, specifically for understanding customer behavior based on different demographic or categorical variables.

1. Group Calculation

- It creates a cross-tabulation (contingency table) of the data, which helps in understanding the relationships between two categorical variables (`[cat]` and `'Product'`) by calculating the frequency distribution of these variables.

2. Probability Calculations

- **Marginal Probability:**
  - It calculates the probability of each category in the specified column contributing to total sales.
  - The probability of a product being bought given the customer's category.
  - The probability of a customer belonging to a category given that they bought a specific product.

```
[1013]: # Cell 2: Calculations

        # Define the function for probability calculations
        def group_calculations(df, cat):
            # Group by the specified column and 'Product', and count the occurrences
            grouped = df.groupby([cat, 'Product'])[cat].count().unstack()

            # Calculate marginal probabilities
            marginal_probs = grouped.sum(axis=1) / len(df)

            # Calculate conditional probabilities
            conditional_probs = grouped.div(grouped.sum(axis=1), axis=0)

            return grouped, marginal_probs, conditional_probs

        # Apply the function to the 'Gender' column
        gender_grouped, gender_marginal, gender_conditional = group_calculations(df, 'Gender')

        # Apply the function to the 'Age' column
        age_grouped, age_marginal, age_conditional = group_calculations(df, 'Age')

        # Apply the function to the 'Education' column
        education_grouped, education_marginal, education_conditional = group_calculations(df, 'Education')

        # Apply the function to the 'Marital_Status' column
        marital_status_grouped, marital_status_marginal, marital_status_conditional = group_calculations(df, 'Marital_Status')

        # Apply the function to the 'Income' column
        income_grouped, income_marginal, income_conditional = group_calculations(df, 'Income')

        # Apply the function to the 'Fitness' column
        fitness_grouped, fitness_marginal, fitness_conditional = group_calculations(df, 'Fitness')

        # Apply the function to the 'Miles' column
        miles_grouped, miles_marginal, miles_conditional = group_calculations(df, 'Miles')

Analyzing Gender Column

Product	80-100	40-50	50-60	60-70
Gender				
Female	40	23	7	15
Male	32	20	26	10
All	72	43	33	25

- Marginal Probability of each category contributing to total sales:
  - $P(Female) = \frac{40}{72} = 55.56\%$
  - $P(Male) = \frac{32}{72} = 44.44\%$
- Conditional Probability of a product being bought given the customer's category:
  - $P(Female|Female) = \frac{40/72 \cdot 0.556}{0.556} = 55.56\%$
  - $P(Male|Female) = \frac{23/43 \cdot 0.556}{0.556} = 29.74\%$
  - $P(80-100|Female) = \frac{40/72 \cdot 0.556}{0.556} = 55.56\%$
  - $P(40-50|Female) = \frac{23/43 \cdot 0.556}{0.556} = 29.74\%$
  - $P(50-60|Female) = \frac{7/43 \cdot 0.556}{0.556} = 9.03\%$
  - $P(60-70|Female) = \frac{15/43 \cdot 0.556}{0.556} = 19.38\%$
  - $P(80-100|Male) = \frac{32/72 \cdot 0.444}{0.444} = 44.44\%$
  - $P(40-50|Male) = \frac{20/43 \cdot 0.444}{0.444} = 27.78\%$
  - $P(50-60|Male) = \frac{26/43 \cdot 0.444}{0.444} = 36.11\%$
  - $P(60-70|Male) = \frac{10/43 \cdot 0.444}{0.444} = 13.89\%$
- Conditional Probability of a customer belonging to a category given they bought a specific product:
  - $P(Female|80-100) = \frac{40/72 \cdot 0.556}{0.444} = 56.34\%$
  - $P(Male|80-100) = \frac{32/72 \cdot 0.444}{0.444} = 44.44\%$
  - $P(Female|40-50) = \frac{23/43 \cdot 0.556}{0.278} = 46.93\%$
  - $P(Male|40-50) = \frac{20/43 \cdot 0.444}{0.278} = 53.07\%$
  - $P(Female|50-60) = \frac{7/43 \cdot 0.556}{0.361} = 21.21\%$
  - $P(Male|50-60) = \frac{26/43 \cdot 0.444}{0.361} = 78.79\%$
  - $P(Female|60-70) = \frac{15/43 \cdot 0.556}{0.139} = 60.00\%$
  - $P(Male|60-70) = \frac{10/43 \cdot 0.444}{0.139} = 40.00\%$

🔍 Inference and Insights

- **Major Customer Segments:**
  - Female (55.56%)
  - Male (44.44%)
- **Product Preferences Across Genders:**
  - Female:80100 (56.34%), 40\|50 (29.74%), 50\|60 (21.21%), 60\|70 (19.38%)
  - Male:80100 (44.44%), 40\|50 (27.78%), 50\|60 (36.11%), 60\|70 (13.89%)
- **Customer Loyalty Indicators:**
  - Both genders show significant likelihood among both genders (55.56% each).
  - 80100 is almost equally favored with a slight preference towards males (57.62%).
  - Female customers show higher loyalty to 40\|50 (46.93%).
- **Targeted Marketing Opportunities:**
  - Focus 80100 promotions on both genders equally.
  - Tailor 40\|50 marketing towards female customers.
  - Strongly target 50\|60 promotions towards male customers.
- **Strategic Recommendations:**
  - Leverage gender-specific marketing for 50\|60 to utilize sales from both male and female customers.
  - Consider gender-neutral marketing for 80100 to maintain sales from both genders.
  - Consider targeted strategies to boost 60\|70 interest among female customers.

🔍 Inference and Insights

- **Major Customer Segments:**
  - Young adults (41.67%)
  - Adults (50.00%)
  - Middle-aged (12.19%)
  - Elderly (2.78%)
- **Product Preferences Across Age Groups:**
  - Young adults:80100 (41.67%), 60\|70 (48.00%), 50\|60 (42.42%), 40\|50 (25.58%)
  - Adults:80100 (50.00%), 40\|50 (48.84%), 50\|60 (42.42%), 60\|70 (48.00%)
  - Middle-aged:40\|50 (25.58%), 50\|60 (12.12%), 60\|70 (8.33%), 80100 (8.33%)
  - Elderly:80100 (2.78%), 40\|50 (2.33%), 50\|60 (6.06%), 60\|70 (4.33%)
- **Customer Loyalty Indicators:**
  - Young adults show high loyalty to 60\|70 (48.00%) and 80100 (41.67%) purchases.
  - Adults show balanced loyalty across 80100 (50.00%), 40\|50 (48.84%), 50\|60 (42.42%), and 60\|70 (48.00%).
  - Middle-aged prefer 40\|50 (25.58%) and 50\|60 (12.12%).
  - Elderly show low loyalty across all products.
- **Targeted Marketing Insights:**
  - Focus on young adults for 60\|70 and 80100.
  - Target adults with balanced marketing across multiple sizes and activity.
  - Target middle-aged with 40\|50 and 50\|60 promotions.
  - Avoid marketing to elderly due to low engagement.
- **Strategic Recommendations:**
  - Leverage strong loyalty for 60\|70 and 80100 to maximize sales.
  - Develop strategies to enhance 60\|70 adoption among middle-aged and elderly.

  - $P(Doctorate) = \frac{10}{72} = 13.89\%$
- Conditional Probability of a product being bought given the customer's category:
  - $P(80-100|Bachelor's\ Degree) = \frac{30/72 \cdot 0.417}{0.417} = 41.66\%$
  - $P(40-50|Bachelor's\ Degree) = \frac{17/43 \cdot 0.417}{0.417} = 39.53\%$
  - $P(50-60|Bachelor's\ Degree) = \frac{7/33 \cdot 0.417}{0.417} = 21.21\%$
  - $P(60-70|Bachelor's\ Degree) = \frac{10/25 \cdot 0.417}{0.417} = 40.00\%$
  - $P(80-100|Master's\ Degree) = \frac{32/72 \cdot 0.444}{0.444} = 44.44\%$
  - $P(40-50|Master's\ Degree) = \frac{20/43 \cdot 0.444}{0.444} = 46.51\%$
  - $P(50-60|Master's\ Degree) = \frac{23/33 \cdot 0.444}{0.444} = 69.70\%$
  - $P(60-70|Master's\ Degree) = \frac{10/25 \cdot 0.444}{0.444} = 40.00\%$
  - $P(80-100|Doctorate) = \frac{10/72 \cdot 0.139}{0.139} = 13.89\%$
  - $P(40-50|Doctorate) = \frac{7/43 \cdot 0.139}{0.139} = 16.28\%$
  - $P(50-60|Doctorate) = \frac{3/33 \cdot 0.139}{0.139} = 9.09\%$
  - $P(60-70|Doctorate) = \frac{5/25 \cdot 0.139}{0.139} = 20.00\%$
- Conditional Probability of a customer belonging to a category given they bought a specific product:
  - $P(Bachelor's\ Degree|80-100) = \frac{30/72 \cdot 0.417}{0.444} = 48.33\%$
  - $P(Master's\ Degree|80-100) = \frac{32/72 \cdot 0.444}{0.444} = 44.44\%$
  - $P(Doctorate|80-100) = \frac{10/72 \cdot 0.139}{0.444} = 7.23\%$
  - $P(Bachelor's\ Degree|40-50) = \frac{17/43 \cdot 0.417}{0.278} = 45.45\%$
  - $P(Master's\ Degree|40-50) = \frac{20/43 \cdot 0.444}{0.278} = 53.49\%$
  - $P(Doctorate|40-50) = \frac{7/43 \cdot 0.139}{0.278} = 1.03\%$
  - $P(Bachelor's\ Degree|50-60) = \frac{7/33 \cdot 0.417}{0.361} = 44.24\%$
  - $P(Master's\ Degree|50-60) = \frac{23/33 \cdot 0.444}{0.361} = 55.76\%$
  - $P(Doctorate|50-60) = \frac{3/33 \cdot 0.139}{0.361} = 3.43\%$
  - $P(Bachelor's\ Degree|60-70) = \frac{10/25 \cdot 0.417}{0.139} = 60.00\%$
  - $P(Master's\ Degree|60-70) = \frac{10/25 \cdot 0.444}{0.139} = 40.00\%$
  - $P(Doctorate|60-70) = \frac{5/25 \cdot 0.139}{0.139} = 36.00\%$

🔍 Inference and Insights

- **Major Customer Segments:**
  - Master's Degree (44.44%)
  - Bachelor's Degree (41.66%)
  - Doctorate (13.89%)
- **Product Preferences Across Education Levels:**
  - Bachelor's:80100 (41.66%), 60\|70 (40.00%), 50\|60 (21.21%), 40\|50 (39.53%)
  - Master's:80100 (44.44%), 40\|50 (46.51%), 50\|60 (69.70%), 60\|70 (40.00%)
  - Doctorate:80100 (13.89%), 40\|50 (16.28%), 50\|60 (9.09%), 60\|70 (20.00%)
- **Customer Category Analysis:**
  - Bachelor's and Master's loyalty dominates 80100 purchases (48.33% each).
  - Master's show high loyalty across 40\|50 and 50\|60.
  - Bachelor's show high loyalty across 60\|70.
- **Targeted Marketing Insights:**
  - Focus on Master's Degree holders for 80100 and 40\|50.
  - Target Master's Degree holders for 50\|60 and Bachelor's holders.
  - Target Bachelor's Degree holders for 60\|70.
- **Strategic Recommendations:**
  - Leverage Master's Degree holders' purchasing behaviors to boost sales.
  - Develop strategies to enhance 60\|70 adoption among Bachelor's and Master's holders.

3. Results of Inferential Analysis and Business Insights

Customer Profiling and Strategizing Market Capture: Fitness Product Analysis

Customer Characteristics	KP281	KP481	KP781
Customer Demographics	- Young adults, diverse genders - Mostly Bachelor's or Master's degrees - Moderate fitness, low to medium income - Short to medium-distance exercise goals	- Young adults and adults, slight male skew - Mostly Bachelor's or Master's degrees - Moderate fitness, medium income - Short to medium-distance exercise goals	- High income men, particularly Doctorate holders - High fitness levels, long-distance exercise goals
Potential Sales Improvements	- Target young adults with low to medium income - Emphasize fitness benefits for short to medium-distance exercise goals	- Focus on medium-income adults - Highlight product benefits tailored to moderate fitness levels and exercise goals	- Craft marketing to attract high-income women - Emphasize product suitability for long-distance exercise goals - Highlight product exclusivity and performance for high fitness enthusiasts - Attract more female customers
Identified Opportunities	- Leverage educational and fitness motivations for engagement	- Create inclusive marketing for medium income adults	- Collaborate with luxury fitness brands for promotions - Introduce special editions for high-income female customers
Action Points for Driving Opportunity	- Develop targeted educational and fitness-focused content - Engage with fitness communities and offer personalized recommendations	- Enhance product visibility through partnerships with fitness influencers and sponsor events	- High-income professionals in executive positions - Members of exclusive fitness clubs - Residents of upscale neighborhoods
Target Focus Group	- Young adults in schools and universities - Office workers in mid-sized companies - Business owners in small enterprises	Office workers in corporate environments - Gym owners and fitness instructors - Residents of gated communities	- Partner with high-end fashion brands for joint promotions - Advertise in upscale lifestyle magazines and events - Host exclusive product launch events
Marketing Approach	- Engage through social media platforms popular among youth - Offer student and employee discount programs - Sponsor local community events and sports tournaments	- Collaborate with corporate wellness programs - Advertise in fitness magazines and health-related websites - Host fitness challenges and workshops	

4. Further Exploration and Predictive Customer Profile Modelling

- **Product Recommendation:** The rule generates a cross-tabulated and identifies the product with the highest proportion for each demographic group, enabling personalized product recommendations. This approach ensures relevant product suggestions based on customer profiles and past purchases, the rule calculates the number of cross-tabulations and overall mode across grouping insights into the model's predictions.
- **Data Integration:** The left join merges original data with cross-tabulated results, enriching the dataset with predictions and recommendations for further analysis and decision making.

For certain stores that our model can accurately predict the product preference of customers based on their demographics and characteristics with an accuracy of 90.01%. This means that the model correctly classifies the product choice for 150 out of 170 customers.

Key Insights:

- **High Accuracy:** The model has a high accuracy rate, suggesting it is reliable for predicting customer preferences.
- **Customer Segmentation:** By analyzing factors such as gender, marital status, age category, education level, fitness level, income bracket and exercise goals, we can determine the most suitable product for each customer.

Recommendations:

- **Targeted Marketing:** Use the model to identify and target specific customer groups with tailored marketing strategies.
- **Customer Profiling:** Develop comprehensive profiling to understand customer preferences and enhance satisfaction.

Example of How to Use the Model:

- **Product Recommendation:** For a new customer, input their age category, education level, fitness level, income bracket, and exercise goals.
- **Predicted Preference:** The model will predict whether the customer is likely to prefer KP281, KP481, or KP781.
- **Implement Marketing Strategies:** Based on the prediction, implement targeted marketing and sales strategies to increase customer engagement and sales.

This model helps ensure that marketing efforts are more effective by aligning them with the specific preferences and characteristics of the customers.
